BrandStore — Launch Report

Item	Value
Release	v1.0.1 (git tag `v1.0.1`, see `CHANGELOG.md`)
Date	2026-11-12
Author	Ahmed
Live demo URL	Pending: added after deployment (steps in `docs/RUNBOOK.md`)
Repository	this folder (`.git` included); technical detail in `README.md` sections 7, 12, 13 and 20–25

1. What Was Built

BrandStore is a small online-shop front end with three pages: a landing page (hero offer, four categories, a filterable list of three products, a scrolling strip of six launch offers, two customer quotes and an email sign-up), a side-by-side product comparison page, and a "page not found" page. It is plain HTML, CSS and JavaScript with no server, so it loads quickly and can be hosted for free. The sign-up form checks the address and answers on screen, but nothing is sent or stored. There is no checkout, login or database in this version.

2. Endpoint Table

The site is static, so it has no API endpoints. These are all the addresses a visitor or a search engine can open.

Route	File	What it is	Indexed by search engines
`/`	`index.html`	Landing page; sections `#categories`, `#featured`, `#deals`, `#testimonials`, `#newsletter`	Yes
`/comparison.html`	`comparison.html`	Product comparison table	Yes
any unknown address	`404.html`	Page not found (served by Netlify)	No (`noindex`)
`/robots.txt`	`robots.txt`	Rules for crawlers; points to the sitemap	n/a
`/sitemap.xml`	`sitemap.xml`	Lists the two indexable pages	n/a
Backend / API	none	Sign-up is simulated in the browser	n/a

3. SEO Summary (per page)

Page	Title (unique)	Meta description (unique)	Open Graph + Twitter tags	h1 count
`index.html`	BrandStore — Curated Electronics, Apparel & Modern Essentials	134 characters	Yes, with 1200x630 image	1
`comparison.html`	Product Comparison — BrandStore	127 characters	Yes, with 1200x630 image	1
`404.html`	Page not found — BrandStore	99 characters	Yes, with 1200x630 image	1

4. Key Decisions

- **No frameworks or build step.** Anyone can open the folder and edit it. The trade-off is that the product list lives in a JavaScript file, not a database.
- **Accessibility first:** a "skip to main content" link, labelled page regions, every control reachable by keyboard with a visible focus ring, errors read out by screen readers, and reduced animation for people who ask for it.
- **Security headers** (Netlify only): pages may only load their own scripts, styles and images, and cannot be embedded in other sites.

5. Deviations List

#	Deviation	Why	Effect / follow-up
1	Canonical and share links use the placeholder `https://brandstore.example` until deployment	The real address is only known after deploying	Run `node scripts/set-site-url.js <url>`; `node qa/preflight.js --release` fails until this is done
2	The 404 page shows correctly only for unknown addresses at the site root	Assets use relative paths so the site also works from a folder and on GitHub Pages	A deep wrong address such as `/a/b` shows the text without styling; fix with root-relative paths once the host is fixed
3	Phones and tablet were tested by emulation in Chrome, not on real devices	No real devices or other browsers in the build environment	Real-device, Firefox and Safari/Edge rows are pending (section 6)
4	Our own accessibility/SEO audit stands in for Lighthouse and axe until they are run on the live site	Those tools were not available offline	Results in section 7 are pending; the audit is not reported as Lighthouse or axe

6. QA Matrix (browser x viewport)

Each row runs the same script (`node qa/matrix.js`): loads without console errors, no sideways scrolling, three products, quotes, menu or links, filter, deals buttons, newsletter error and success, skip link, comparison table, 404 page.

Browser	Viewport / device	Result	Notes
Chrome 153	Desktop 1440x900	PASS	Measured
Chrome 153	Laptop 1024x768	PASS	Measured
Chrome 153	Tablet 768x1024 (iPad Mini profile)	PASS	Measured, emulated
Chrome 153	Phone 375x667 (iPhone SE profile)	PASS	Measured, emulated
Chrome 153	Phone 390x844 (iPhone 13 profile)	PASS	Measured, emulated
Chrome 153	Phone 412x915 (Pixel 7 profile)	PASS	Measured, emulated
Firefox	Desktop	Pending	Owner runs on the live site
Safari or Edge	Desktop	Pending	Owner runs on the live site
Real phone	Owner's phone	Pending	Owner runs on the live site

7. Lighthouse and axe Results

Tool	Page	Result
Lighthouse (mobile): Performance / Accessibility / Best Practices / SEO	landing, comparison	Pending: run on the live URL
axe DevTools: Critical / Serious / Moderate / Minor	landing, comparison	Pending: run on the live URL
Screen reader (NVDA, VoiceOver or TalkBack)	landing	Pending: script in `docs/RUNBOOK.md`
Own offline audit `node qa/preflight.js` (not Lighthouse or axe)	all three pages	163 of 163 checks pass (166 after the real URL is set)
Text contrast audit `node qa/contrast.js`	landing	Lowest ratio 5.02:1; the standard asks for 4.5:1

Targets: Lighthouse Accessibility and SEO at least 90; axe shows no Critical issue.

8. Bug Found and Fixed During QA

Symptom: with the browser's text size at 200%, the last links in the top menu were cut off at the right edge on desktop widths, so a visitor could not read or click them. **Found by:** the audit that enlarges text. **Cause:** the menu was a single row that could not wrap. **Fix:** the header and menu now wrap onto a second line. **Check:** a screenshot at 200% shows every link, and the layout, keyboard and audit checks still pass. Two smaller fixes are listed in `CHANGELOG.md`.

9. Limitations

- Sign-up is simulated: no emails are collected. The products are three sample items, not a catalogue.
- The security headers only apply on Netlify; GitHub Pages ignores them.
- Pixel-level match to the Figma design was not measured.

10. Next Steps

1. Deploy, set the real URL, then run Lighthouse, axe and the screen-reader pass and replace each "Pending" with the result.
2. Make asset paths root-relative so the 404 page is styled for any mistyped address.
3. Connect the sign-up to a real email service and the products to a data source.
4. Add checkout, product detail pages, and analytics with a cookie notice.
